

7 SIGNS YOU NEED TO CALL A PLUMBER

1. Unit is leaking

Water damage is a costly out-of-pocket expense or homeowners' insurance claim. If your water heater is leaking, call a plumber as soon as possible to have it inspected and potentially replaced.

2. No hot water

If you are not getting hot water from any of your faucets, call a plumber so they can identify the problem.

3. Pilot light won't stay lit

This can occur with natural gas or propane water heaters. A plumber can safely get to the root of the cause and fix this for you.

4. Running out of hot water

This can be an indication that your water heater needs to be serviced, is at the end of its life or may be undersized. A plumber can help you decide whether to replace it or look for other ways to get more hot water out of your unit.

5. Proactive replacement

Knowing the age of your water heater can prevent problems and water damage. The average heater in the U.S. lasts for roughly a decade and it's best to replace it before it goes out or causes any issues.

6. Interested in upgrading

If you want to proactively find the best water heater for your home, it's time for an upgrade. Think tankless for continuous hot water, get all the smart features with Gladiator™ or find energy savings with the newest hybrid – ProTerra™.

7. Unit needs to be serviced

There are recommended maintenance items that you should consider to take care of your water heater and extend its life such as flushing tankless units, draining tanks to reduce sediment buildup or replacing anode rods to extend the life of the tank.
